The relevance of this study is related to the increasing role of prognostic models in the management of production systems, which is associated with the increased requirements for management efficiency and the need to take into account external factors affecting the system and the consideration of ongoing processes in dynamics and in interconnection between the chain of managerial decisions and the values of the used management parameters. The goal of the study is the solution of scientific and practical problem of the development of models and supporting methods for the effective decision-making in the management of project implementation processes in production systems on the basis of the data analysis of the life circle of projects, of their interaction with other projects within the framework of the system under consideration and taking into account the time factor. In order to gain this goal we use methods of innovation management from the point of performance management indicators; formalization of management tasks in the form of predictive models; DataMining for intellectual data analysis and support for decision-making management; predicting the parameter values presented in the form of time series and the application of time series as a way of representing the process parameters under study; approaches from a wide field of semi-supervised training, taking into account structured and unstructured data at the same time; methods for assessing the credibility of taken management decisions. The data considered in the monograph allow to receive and to solve the tasks of the management of production systems arising in the practice based on the forecast data for sets of indicators and parameters involved in decision-making. That makes it possible to increase the validity and quality of management decisions.

Keywords: *project management, production systems management, forecast, time series, risk assessment, management parameters, data preparation, DataMining, statistics, training.*

Contents

Preface	7
Introduction	9
1 Innovation performance management	15
1.1 Terms and definitions	16
1.1.1 Processes and projects	16
1.1.2 Project portfolio	18
1.1.3 Innovation management	19
1.1.4 Performance management	22
1.2 Performance management for innovation activities	23
1.2.1 Published performance measurement systems	24
1.2.2 A new approach for quantitative control of innovation activities	24
1.3 The framework of innovation management indicators	27
1.3.1 Measurement of output	27
1.3.2 Measurement of input	29
1.3.3 Measurement of capacity utilisation	31
1.3.4 Measurement of duration	32
1.3.5 Measurement of adherence to schedules	33
1.3.6 Measurement of availability	34
1.3.7 Measurement of reliability	36
1.3.8 Measurement of stakeholder satisfaction	37
1.3.9 Measurement of changes	39
1.3.10 Measurement of problems and issues	40
1.3.11 Measurement of risks	41
1.3.12 Measurement of incidents	42
1.3.13 Measurement of size	43

Contents

1.3.14	Measurement of complexity	45
1.3.15	Return on investment (ROI)	46
1.4	Stop-or-go decisions	47
1.4.1	Stopping processes	48
1.4.2	Stopping projects	48
1.5	Summary to chapter 1	54
2	Formalization of management tasks in production systems	55
2.1	General setting of management task in production-and-economic systems	56
2.2	Optimal management and control in production systems . .	60
2.2.1	The tasks of project implementation management in production systems	60
2.2.2	Management and control tasks of production system that implements commodity projects	64
2.2.3	Procurement and stock control	68
2.2.4	Waste management	69
2.3	Joint consideration of optimal management and control tasks by taking into account the factor of time	72
2.4	The interaction of economic efficiency and the parameters of production system	74
2.5	The specifics of decisions as the functions of time	78
2.6	Summary to the chapter 2	81
3	Data preparation for management support systems . . .	82
3.1	Data selection	84
3.2	Data cleansing	86
3.2.1	Data integration and cleansing	87
3.2.2	Cleansing of erroneous data	89
3.2.3	Methods for data cleansing	90
3.3	Handling missing attribute values	91
3.4	Discretization methods	93
3.4.1	Unsupervised discretization methods	95
3.4.2	Supervised discretization methods	96
3.5	Dimension reduction and feature extraction	97
3.5.1	Feature generation	98
3.5.2	Feature selection	100

3.5.3	Data Visualization	102
3.5.4	General dimension reduction algorithms	104
3.6	Outlier detection	106
3.6.1	Outlier detection based on statistical models	108
3.6.2	Proximity-based outlier detection	110
3.6.3	Outlier detection in high-dimensional data	110
3.7	Summary to chapter 3	111
4	Some aspects of work with time series	112
4.1	The tasks of time series analysis	113
4.2	Anomaly detection	114
4.2.1	Pattern fragment detection (based on the elements of time series)	116
4.3	ST Index	123
4.4	Time series as storage object	126
4.5	Conclusion of the chapter 4	133
5	Semi-supervised learning	135
5.1	The learning problem	138
5.2	Semi-supervised classification	141
5.2.1	Self-training	142
5.2.2	Graph-based methods	145
5.2.3	Generative models	150
5.3	Constrained clustering	154
5.3.1	COP- k -Means	156
5.3.2	PCKMeans	156
5.3.3	MPCCKMeans	159
5.4	Summary to chapter 5	163
Conclusion	164
Bibliography	165
Index	178
